bioregion and Cauca valley river specialties.**

Nov 19 to Dec 2/2018

Edwin Acevedo

Tour leader Native Birding Colombia

Gray-breasted mountain Toucan

This classic tour visited the well known and very good access places on Andes to enjoy of its rich avifauna, We were moving on premontane, humid, dry and highland forest and Paramo ecosystem. The weather was excellent with sunny days; but most of the time we were under shadow, different from the

first day along Porce area and day five in Bolombolo area near Cauca river which were hot; some rains at nights in some places and one morning in Tatamá N P; but did not affected our goals, birds were very active and the birders were so focused and skilled; transfers on time; everything flowed as desired; which is always our aim. Predominant bird Families were (Thraupidae) 79 taxa, Hummingbirds (Trochilidae) and Tyrant -Flycatchers 49 taxa each one. It was very ample about bird groups diversity. We shared lovely memories on field and everyone was satisfied !

This bird list follows broadly the taxonomy of South American Classification Committee SACC (2018). Each specie has the locality were it was recorded more easy; some of the birds could be seen in different spots.
